

A02 – Move the starship

The WebGL application contained in file `index.html`, wants to perform 7 transformations using the code written in file `draw.js`.

If you see the code in `draw.js`, you will see that all transforms are initialized to the identity matrix (which performs no transform). Your goal is to modify such matrices to obtain the desired effect.

If you open `index.html` in Google Chrome or in some other WebGL supported browser, you will see at top of the page the requested transform, and a wireframe view of the wanted result. If you press space, it will add a filled view of the ship using the transform you supplied in the file `draw.js`. If the two ships matches (wireframe and solid), you done it right! You can press space and move to the next transform.
